

WINDOW DECAL APPLICATION

These decals are only designed to be applied to glass surfaces. Do not apply to a car's finished surfaces.

To achieve proper application of the vinyl decal, the glass surface needs to be cleaned with a mixture of 2 parts water to 1 part isopropyl alcohol. Use a clean, dry, lint-free cloth to remove any moisture or dust left on the surface. The air and glass surface must be above 45°F before applying the decal. Any moisture left on the glass and trapped under the decal will freeze in colder weather, causing the decal to crack and flake off the glass.

Once the glass has been cleaned, remove the white backing from the decal. Stick the center of the decal to the glass and apply pressure from the center outward with a flat-edged object (like a credit card).

After the decal is applied, allow the surface to remain above 45°F until surface is dry and no moisture is on the decal.

The decal can be cleaned with standard mild car washing solutions. If the decal is applied correctly, a car with a decal can be run through an automatic car wash with no harm to the decal.
